

What can building data do for you?

1. Saving

Add AI to the existing control system. Result: at least 15% saving; the deficit in the 2030 climate target. By simply a software link that learns from the past and anticipates the future.

2. Validation

Much information is available and can be used to validate whether human interpretations are correct. For example: will insulation achieve the savings indicated by the measure?

3. Greening

AIMZ calculates which combination of measures suits your real estate. This allows you to efficiently become more sustainable and the roadmap of investments up to 2030 is established for you (validated).

4. Broaden

From planned maintenance to customised maintenance: it requires up-to-date data. Your building can provide this data. AI enlightens efficiently, saving you unnecessary maintenance expenses

5. Strategic decisions

Future-proof real estate must fit within the environment. Solar panels or building data will not suffice only, but you'll exchange information with third parties. As a result, you connect perfectly with the Regional Energy Strategy (RES).
